                                                                                                                                                                                                                                                                                                                                                                                                                         Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif, a glycosaminoglycan binding for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts contracts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a peptide of the calcium binding motif
                                                                                                                        21-FEB-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif, a plycosaminoglycan binding for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts context that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a peptide of the calcium binding motif

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      X200000000000XX
                   The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or I- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an integring bone loss and for reducing renal phosphate excretion in an integring bone loss and for reducing renal phosphate excretion in an integring the sequence of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an integring the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of osteoblast or odontoblast cells on the surface of the new skeletal growth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts /osteoclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or meakness. This sequence represents a C-terminal amidated synthesised contention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptide compound useful for reducing bone loss, is capable of enhancing bone growth, and comprises an integrin binding motif, glycosaminoglycan binding motif or a calcium binding motif -

Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of osteoblast or odontoblast cells on the surface of the new skeletal growth. AAU93861-AAU93726 represent bone growth enhancing peptides for use in dental products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts osteoclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a protein of a matrix extracellular phosphoglycoprotein containing an RGD motif of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide compound useful enhancing bone growth, and c glycosaminoglycan binding mc

Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of osteoblast or odontoblast cells on the surface of the new skeletal growth. AAU93681-AAU93726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss;
                                                                                                                                                                                                                    New peptide compound useful for reducing bone loss, is capable enhancing bone growth, and comprises an integrin binding motif, glycosaminoglycan binding motif or a calcium binding motif -
                                                                                                                                                                                                                                                                                                                                    WPI;

The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amin acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is usually constitution of the invention is usually constitution.

invention is useful

the band pattern produced in conventional differential RNA display (where bands may be obscured, resulting in false positive signals) since most bands common to both samples are eliminated, allowing identification and cloning of genes displaying anticipated differential expression. RSDD
                                                                                                         This is the amino acid sequence of the PSGen12 protein (progression suppressed gene 12). PSGen12 has suppressed expression in progressed tumour cells. The PSGen12 nucleic acid sequence was identified using new methods for identifying nucleic acids differentially expressed between two samples. The method involves performing reciprocal subtraction differential RNA display (RSDD) between the two samples to generate two subtraction samples. The subtraction samples are amplified and compared to identify those nucleic acids that are differentially expressed genes, used to identify and clone differentially expressed genes, particularly those with increased or reduced expression during tumour particularly those with increased or reduced expression during tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts /osteoclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a protein of a matrix extracellular phosphoglycoprotein containing an RGD motif of the invention.
                                                                            cell progression, e.g. progression suppressed genes (PSGen) and progression elevated genes (PEGen). The method reduces the comp
                                                                                                                                                                                                                                                                                            Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Progression suppressed gene; PSGen; progression elevated tumour; reciprocal subtraction differential RNA display;
                                                                                                                                                                                                                                                                                                                          Identifying nucleic acids differentially expressed between two samples, particularly sequences involved in tumour progression
                                                                                                                                                                                                                                                                                                                                                                                                                        Fisher

excreted

phosphaturic

relates to a novel human protein, metastatic-tumour phaturic element (MEPE) or phosphatonin (modulator of vitamin-D metabolism). The phosphatonin for treating a

polynucleotides phosphate and

and

specific antibodies are

for treating

```
cc mineralization. Phosphatonins are used to treat hyperphosphatemia, renal cc osteodystrophy, secondary hyperparathyroidism, osteitis fibrosa cystica corgout. It is used to prepare a medicament for treating X-linked cc hypophosphatemic rickets, hereditary hypophosphatemic rickets with cc hypophosphatemic rickets, hereditary hypophosphatemic rickets with cc juveniles, oncogenic hypophosphatemic osteomalacia, renal phosphate cc leakage, renal osteodystrophy, osteoporosis, vitamin-D resistant rickets, cc disease, kidney failure, renal fanconi syndrome, autosomal rickets, Paget's cc disease, kidney failure, renal tubular acidosis, cystic fibrosis or cs srue. Phosphatonin polynucleotides are useful as molecular weight cc markers on Southern gels, as diagnostic probes for detecting the presence of a specific mRNA. Phosphatonin polypeptides are also useful for cc identifying agonists and antagonists, compounds which bind to phosphatonin and drug candidates for therapy of phosphate metabolism cc phosphatonin (MEPE).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           osteoregulin proteins, nucleic acids which encode them, vectors, antibodies, host cells which express heterologous osteoregulins, and animal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with osteoregulin activity. The modulators of activity may be useful in the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification (claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
            The present sequence is that of human osteoregulin, a nover process, which plays a role in regulating bone homeostasis, adiposity, and the calcification of atherosclerotic plaques. The sequence is the calcification of atherosclerotic plaques. The sequence is
                                                                                                                                                                                                Novel osteoregulin polypeptide useful for regulating be adiposity and calcification of atherosclerotic plaques measuring the activity of osteoregulin -
                                                                                                                                                    Claim 1;

```
Sequence 17, Application US/09242435

Patent No. 6461863

Patent No. 6461863

Patent INFORMATION:

APPLICANT: JARVIS, DONALD L.

TITLE OF INVENTION: MACHIOVIRG INSECT CELL GLYCOSYLATION PATHWAYS WITH

TITLE OF INVENTION: BACULOVIRUS EXPRESSION VECTORS

FILE REFERENCE: UMY0:002US

CURRENT APPLICATION NUMBER: US/09/242,435

CURRENT EILING DATE: 1999-02-16

NUMBER OF SEQ ID NOS: 30

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 17

LENGTH: 14

TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
                                   APPLICANT: Bhattacharjee, J.
APPLICANT: Suvarna, Kalavati
APPLICANT: Bhattacherjee, Vasker
TITLE OF INVENTION: METHODS AND REAGENTS FOR DETECTING FUN
TITLE OF INVENTION: A BIOLOGICAL SAMPLE
FILE REFERENCE: 96,247-A
CURRENT APPLICATION NUMBER: US/09/106,568E
CURRENT FILING DATE: 1998-06-29
PRIOR APPLICATION NUMBER: 08/650,809
PRIOR APPLICATION NUMBER: 08/650,809
PRIOR FILING DATE: 1997-05-20
NUMBER OF SEQ ID NOS: 160
SOFTWARE: Microsoft Word 97
